

# INTELLIGENT HOME SCREEN BY LARVA LABS

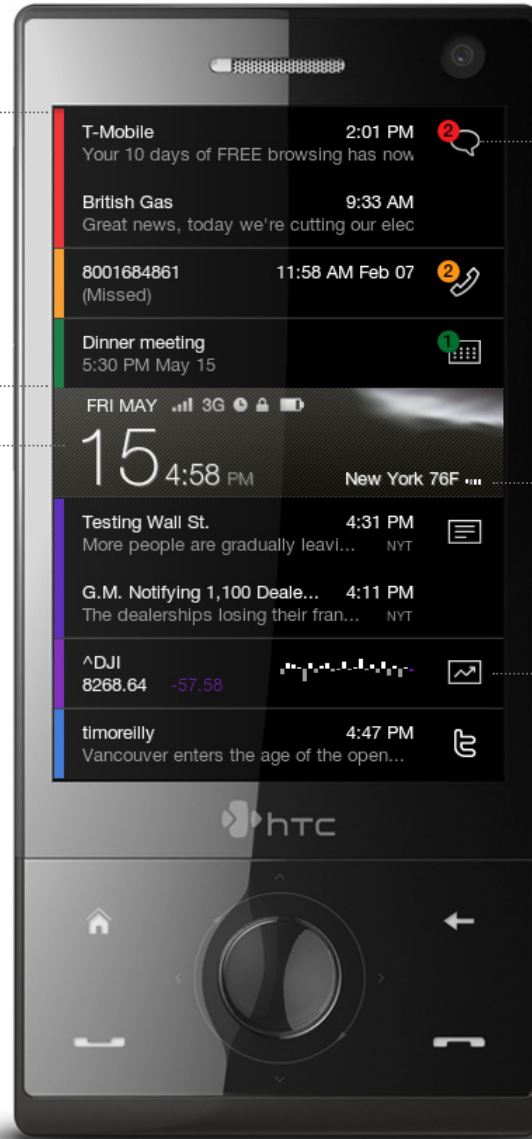

Larva Labs proposes an intelligent home screen that creates a **meaningful hierarchy out of a user's information**. Designed for an Android-based handset, our home screen is intended to appeal to Blackberry owners and people struggling with information overload.

**Color coding** indicates different categories of information (e.g. text messages, phone calls, calendar events.) The latest information in each category is always visible.

**Draggable center bar** divides messages and appointments from news, stocks and more general information.

User can show more or less personal information by sliding bar vertically.

**Icons** on the right-hand side link to the full application for each category.

User can flip through **weather, date and time** for several cities via the weather section of the center bar. A **micro-forecast** gives a compact indication of the week ahead.

Real-time **stock quotes and news** can be selected by the user, or retrieved from an online portfolio.
